Read solution brief for Capital Markets

Why exchanges need fault-tolerant solutions today

Writing availability into applications proving risky

Australian securities exchange

Failure in trade database results in:

- One hour delay in opening
- Series of consequences affecting trading throughout the day
- Closing more than one hour earlier than expected

Singapore securities exchange

Undetected hard disk failure results in:

- More than half a day of no trades due to early closing
- Fourth trading glitch in four years while running with availability written into application

American securities exchange

Technical hardware glitch results in:

- Four hour closing and no trading available
- Unnerved investment market and a continued questioning about the fragility of technologies role in the financial markets

A microsecond of downtime can cause losses everywhere

Risks of writing availability into the applications

Application developers time and skill level

- 30-40% of critical application code is written to support high availability and failover

Application latency

- It's comparatively easy to find latency in hardware and the network; however, the real overheads are in the application

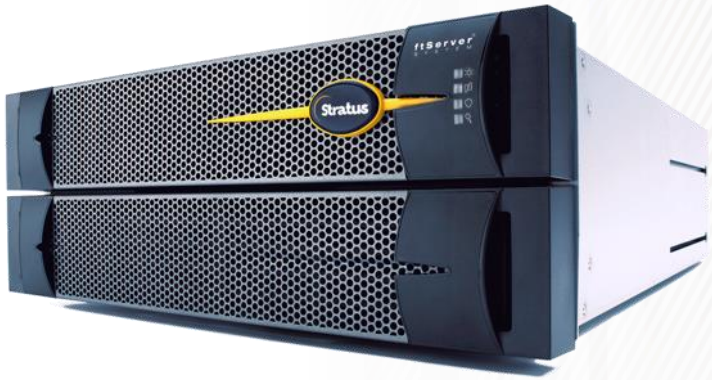
Regulatory pressures

- Regulations, including REG SCI, are growing and significantly raising the risk profile on exchanges and dark pools

Your business can't afford the overhead that writing availability code into the application requires while not confidently achieving the availability every microsecond deserves

Stratus fault-tolerant hardware solutions

Today Stratus ftServer is the only trusted high performance, low jitter fault-tolerant platform that is flexible and simple to deploy. Stratus ftServer is a fully hardware resilient server that replicates everything in hardware, including CPU.



Requirements under consideration for tomorrow's challenges

- Larger configurations (4 way)
- More cores and/or higher frequencies (3.2GH)
- Precision time (PTP)
- Converged / Hyper-converged
- Security layer in Solarflare adapters (SF 8500 series)

SOLARFLARE®

Stratus prevents application downtime

Our solutions enable the simple deployment and management of cost-effective continuously available infrastructures without changing your applications

Continuously available

- 35 year track record of providing 99.999% continuous availability
- Trusted by the world's Global Fortune 500 companies and SMBs
- Competitive advantage for companies depending on business critical applications

Operationally simple

- Applications run without specialized expertise or architectural changes
- Standards based platform running native Linux, VMware or Windows to fit any environment
- Options to deploy in the datacenter to the outer edge of the network

Cost effective

- Simple operation lessens the support burden for IT, even as infrastructure expands
- Prevention of downtime secures reputation, lowers cost and guarantees data integrity and compliance
- Above industry average deployment cycles and support
- Reduce Cap-Ex and Op-Ex with fewer redundant servers

Always-on exchange trading infrastructure projects
